In recent years, the thickness of the substrate of the printed circuit board has been reduced and the weight of the electronic device has been reduced as electronic devices have been miniaturized and lightened. As the printed circuit board is miniaturized and thinned, the ratio of the dielectric layer which has to the thickness of the board is increased. The weight of the dielectric layer used for the printed circuit board is about 25% of the total weight of the printed circuit board. The thickness of the dielectric layer is generally about
